字典表:

字典表实现步骤:

- 1、创建字典表
- 2、根据字典表创建实体类并创建字典表与实体类的映射配置文件.hbm.xml
- 3、确定字典表主键对应的数据是原数据表的哪个字段,修改原数据表的对应关系,一般为 多对一关系

原数据表某一字段对应字典表获取

```
public class Customer implements
private Integer custId;
private String custName;

// private String custSource;
private String custIndustry;
private String custLevel;
private String custAddress;
private String custPhone;

//单向多对一关系(多个客户来源信息对应一个字典表)
private BaseDict custSource;
```

```
<!-- 多对一关系映射 cust_source为外键字段 对应字典表主键--> <many-to-one name="custSource" class="BaseDict" column="cust_source"></many-to-one>
```

4、修改页面数据

html列表颜色设置: list.jsp

<TR \${vs.odd? "style='background-color:#FFFACD'":"style='background-color:#F0F8FF'"} style="FONT-WEIGHT: normal; FONT-STYLE: normal; BACKGROUND-COLOR: white; TEXT-DECORATION: none">
